

=====

PlayList : spring boot full course
channel : india free internship
youtube channel <https://www.youtube.com/@IndiaFreeInternship>
source Code: [spring boot source Code](#)

=====

SESSION 1

-
- 1. SPRING FRAMEWORK**
 - 2. SPRING BOOT**
 - 3. SRPING DATA JPA**
 - 4. SPRING WEB MVC**
 - 5. SPRING REST**
 - 6. SPRING SECURITY**
 - 7. MICROSERVICE**
 - 8. SPRING BATCH**
 - 9. SPRING SCHEDULAR**
- =====

SESSION 2

=====

Technolgies : webPage(servlets) + Database(JDBC/JPA) + Email (Java Mail) + Message(JMS)

Limitations:

- *Start coding from line zero*
- *Development takes more time*
- *More chance of error*
- *Design pattern applied manually*

Framework:

- *Ready-made structure*
- *In-built technologies*
- *Design patterns already implemented*

RAD => Rapid Application Development

- *Fast coding*
- *Less Error*

Spring Framework:

- *used for Web Application or Distributed appliation*
- *It has own Apis*
- *It Follow Container System*

Spring Container

-
- *Find/Scan Classes[spring bean]*
 - *Create Object*
 - *provide DATA*
 - *Link Object based on Relation*
 - *Finally Destroy*

Depedency Injection (DI)

Depedency Injection is a concept/theory which is implemented by spring IoC (Inversion of control) also called as spring container.

Theory	programming
oops	core java
ORM	HIbernate with JPA
DI	Spring Ioc(Inversion of control)

session 3

=====

Application

=====

3 Type of application

- (i) Web Application**
- (ii) Distributed Application**
- (iii) Microservices Application**

(i) Web Application : Collection of web pages run under webserver.

Application : - n services

Project :- n Module

eg : Gmail Application

User(Register and Login) , Inbox, Sent, Drfats, Setting, etc

Amazon Application

User(Register and Login) , search, Cart, Payment, ...etc

=> Implementation of service / module: - This is implemented using 3 Layers Design.

- 1. DAL : Data Access Layer (Database Operations)**
- 2. SL : Service Layer (Calculation/Operations/txn mngmt)**
- 3. PL : Presentation layer (view /Dynamic web pages/MVC)**

PIC 1

=====

(ii) Distributed Application : An Application that runs at mutiple devices is called as distributed appliation.

xyz Bank application

This appliation can be accessed in different ways. Example.

eg:

- 1. Manually Process**
- 2. NetBanking (Web App)**
- 3. Mobile Banking**
- 4. IVR**
- 5. ATM / DC**
- 6. 3rd party app (Gpay, PayPhone..etc)**

.....

-But here business logics exist at backend application.

- Fontend applications are implemented using Angular, Android...etc

- App connected using HTTP Protocol using Global Data Format (JSON/XML)

PIC 2

WebServices:

=====

Intergration of multiple (at least two) applications which runs on different servers and implemented using different language (java, .net, php, python....etc)

PIC 3

PIC 3

session 4

 12. Lifecycle methods
 13. Runners
 14. @ConfigurationProperties
 15. Properties file
 16. YAML File
 17. Profiles
 18. Lombok API

=====
spring core chapter 1
=====

Core:

This module/chapter gives all rules and guidelines to work with spring container.

1. DI and IOC

=====

Spring Container :- It takes care of object.

1. Find/Scan our Classes(spring bean)
2. Create Object
3. Provide Data
4. Link Object
5. Destroy the Object

=>For this programmer has to provide two inputs-

1. Spring Bean : class+rules given by spring container.
2. Spring Configuration : This is main input contains details like object name, relation with objects, data....etc.

xml/java/Annotation

**** Spring Container 2 Types:**

1. BeanFactory (Old container) : support only XML configuration file.

2. **ApplicationContext (New container) :** support xml/java/Annotation configuration.

=====

Dependency Injection (DI)

<i>Theory</i>	<i>programming</i>
<i>OOPs</i>	<i>java</i>
<i>ORM</i>	<i>Hibernate with JPA</i>
<i>DI</i>	<i>Spring IoC(Spring Container) -> Inversion of Control</i>

=> **Depedency** :- An instance variable (Field) exist inside a class (spring bean)

1. **Primitive Type Dependency (PTD)** :- If a variable is created using (8+1) datatype.
(byte, short, int, long, float, double, boolean, char +string)
(Their wrapper classess too)

2. **Collection Type Dependency (CTD)** :- If a variable created using(4) types:
(java.util.package)
(List,Map,Set and Properties)

3. **Reference Type Dependency (RTD)** :- If a variable is creatd using other class/interface

Injection(4)

=====

=> It give/provide/assign existed provide data to Depedency(Inside object)

1. **Setter Injection (SI)** :- provide data to variable using its set method(setter).

2. **Constructor Injection(CI)**: provide data creating object using parameterized constructor.

3. **LookUpMethod Injection(LMI)** :- Spring bean Scope
[When parent bean is sigleton and child bean is prototype]

4. **Interface Injection(II)** :- Not Exist in Spring F/W.

```
class Employee{
    int id;
    String name;
    double sal;
}
```

Employee e=new Employee()

```
class Product{
    int id; //PTD
    String name; //PTD
    Boolean exist; //PTD
```

```
class Vendor{}

interface Service{}
```

```
List<String> models; //CTD
Map<String,Integer> data; //CTD
```

```
Vendor vob; //RTD
Service sob; //RTD
```

```
}
```

SESSION 5

=====

1. Spring Bean

2. STS Installation

Spring Bean

=====

-It is class that follow rules given by Spring Container.

Rule

- class must be public Type.
- Recomended to keep in a package (basePackage Rule)

ex :

com.app.service

com.app.controller

- Fields(Variables) are option, if required recomended to keep private.

```
private Integer empId;
```

```
private String empName;
```

- If variable present in class,

=>define default constructor with setter/getter

=>(or/and) Parameterized Constructor.

ex:

```
public class Employee{  
    private Integer id;  
    private String name;  
    public Employee(){  
    }  
    public void setId(Integer id){  
        this.id=id;  
    }  
  
    public Integer getId(){  
        return id;  
    }  
}
```

e. We can override Object(c) methods:

toString() equals() hashCode()

[because non-private, non-final,non-static]

f. Inheritance Rule:

Allowed ->Only Spring API is allowed (ie spring F/W classes and interface)

not allowed-> EJB, Servlet

g. Annotation Rule:

Only we can add Spring API Annotation and Inetegration API Annotations

(Hibernate with JPA, Restful webServices annotations);

ex:

@Component, @Service, @Repository.. etc.

STS Installation

=====

step 1:

go to official website

spring.io

link : - <https://spring.io/tools#eclipse>

step 2 download STS according your OS

step 3

Right click on ZIP file

click on "Extract Here"

step 4

Open extracted folder

Run : SpringToolsForEclipse

Final STEP STS installed successfully.

=====

session 6

=====

1. Spring Bean

Simple Java class that follow rules given by container.

2. Spring Configuration File(XML)

It gives object

details (name, data, links with other objects ... etc).

3. Test class=> Just find, container created or not? object is created or not?

=====

Spring core XML Tags

=====

<bean> - Object creation

<property> - calling set method

<constructor-arg> - call parameterized constructor

<value> - To provide data to Primitive Type.

<list> <set> <map> <props> -- To provide data to Collection type.

<ref/> -- To Link two objects

1. To create Object

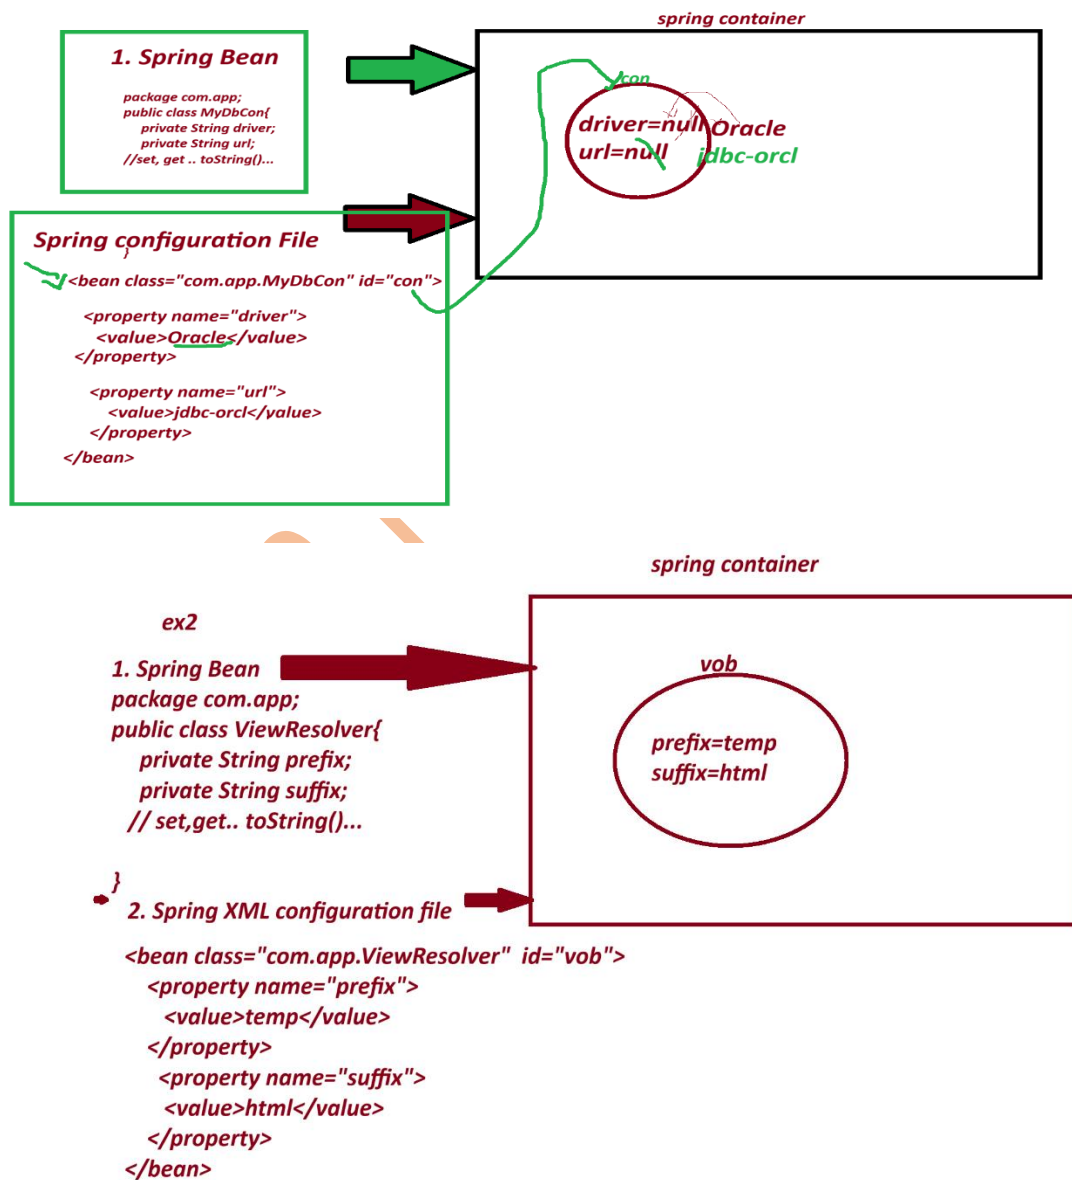

<bean id="objName" class="FullyQualifiedClassName"></bean>

2. To call set method

<property name="variableName"></property>

3. To provide data to Primitive Variables

<value>data</value>

1. Spring bean

package com.app;

```
public class PaymentService{  
  
    private int token;  
  
    private boolean active;  
  
    private String provider;  
  
    //set.. set toString..etc  
  
}
```

2. Spring XML configuration file.

```
<bean class="com.app.PaymentService" id="psObj">  
  
    <property name="token">  
  
        <value>154678</value>  
  
    </property>  
  
    <property name="active">  
  
        <value>true</value>  
  
    </property>  
  
    <property name="provider">  
  
        <value>xyzBank</value>  
  
    </property>  
  
</bean>
```

=====

CREATE MAVEN PROJECT WITH BELOW STEP :-

=====

1. Create Project

File-> New-> Other-> Type maven->choose maven project-> next->

choose checkbox [v] create simple project -> next-> Enter details

groupId : com.app

ArtifactId : FirstApp

version : 1.0

-> Finish

2. pom.xml

```

<project xmlns="http://maven.apache.org/POM/4.0.0"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/xsd/maven-
4.0.0.xsd">

<modelVersion>4.0.0</modelVersion>

<groupId>com.app</groupId>

<artifactId>FirstApp</artifactId>

<version>1.0</version>

<properties>

<maven.compiler.source>21</maven.compiler.source>

<maven.compiler.target>21</maven.compiler.target>

</properties>

<dependencies>

    <!-- Source:
        https://mvnrepository.com/artifact/org.springframework/spring-context -->

    <dependency>

        <groupId>org.springframework</groupId>

        <artifactId>spring-context</artifactId>

        <version>7.0.6</version>

        <scope>compile</scope>

    </dependency>

</dependencies>

</project>

```

session 7

=====

Spring Core First Application 3 Files.

1. Spring bean (.java)
2. Spring XML configuration (config.xml)
3. Test class(.java)

Note:-

1. Spring container are two Types.

(a) Legacy Container : BeanFactory(I) support only XML

(b) New Container : ApplicationContext(i) support all XML/java/Annotation config.

(c) ApplicationContext(I) : it is a interface.

we are using one of its Impl class:

ClassPathXmlApplicationContext(C).

=====
 Create Maven Project with below Step:

=====

```

```
    ApplicationContext ac=new ClassPathXmlApplicationContext("config.xml");
```

```
    Object ob = ac.getBean("mobj");
```

```
    System.out.println(ob);
```

```
}
```

```
}
```

output

Constructor called

Driver method called

Url method called

DbCon [driver=Oracle Driver, url=JDBC-ORCL]

session 8

=====

Spring Container (DI - Depedency Injection)

=>Depedency - Variables exist in class

3 type

1. Primitive Type (8+1) : byte, short, int, long, float, double, boolean, char, String

2. Collection Type (4) : Set, List, Map and Properties

3. Reference Type (x) : using a class/interface variable

=> Injection : provide Data

- Setter Injection

- constructor Injection

LookUpMethod Injetion

- Field Injection (Annotations)

=====

XML TAG

=====

<bean> - Object creation

<property> - calling set method

<constructor-arg> - call parameterized constructor

<value> - To provide data to Primitive Type.

<list> <set> <map> <props> -- To provide data to Collection type.

<ref/> -- To Link two objects

=====

Collection Configuration

=====

=> Spring container support working with collection configuration which are from java.util package

=====

Collection Name	Collection Type	XML Tag Name
=====	=====	=====
List	Interface	<list>
Set	Interface	<set>
Map	Interface	<map> and <entry>
Properties	Class	<props> and <prop>

List -> ArrayList

Set -> LinkedHashSet

Map -> LinkedHashMap

Properties --> NA

coding part collectionTypeS8

session 9

=====

3. Reference Type Dependency - Setter Injection.

=====

=> <ref/> : - tag is used to Link objects in case of HAS-A Relation.

Syntax:

<property name="variableName">

<ref bean="childObjName"/>

</property/>

=====

- If we do not use <ref/> then ref variable holds default value null.

=> spring container creates object to both classes and link them by using <ref/> tag.

=> if child object nam (ref bean name) is not valid or not exist then spring container throws exception like

NoSuchBeanDefinitionException:

=====

project : ReferenceTypeS9

pom.xml

Test.java

package com.app;

import org.springframework.context.ApplicationContext;

import org.springframework.context.support.ClassPathXmlApplicationContext;

public class Test {

public static void main(String[] args) {

ApplicationContext ac = new ClassPathXmlApplicationContext("config.xml");

JdbcOpr jdbc = ac.getBean("jdbcObj", JdbcOpr.class);

System.out.println(jdbc);

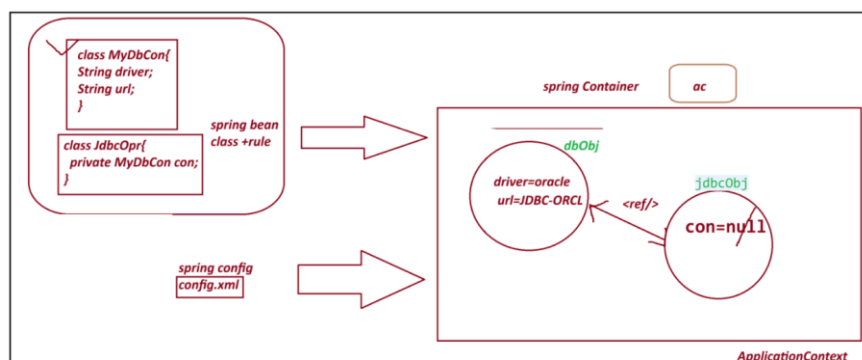

}

}

output

JdbcOpr [con=MyDbCon [driver=OracleDriver, url=JDBC-ORCL]]

=====

SI - Setter Injection :

Spring container creates object to given class using default constructor and provide data using setter method.

Employee emp=new Employee(); =====> <bean id="emp" class="Employee"/>

emp.setEmpId(10); =====> <property name="empId" value="10"/>

=====

*** Constructor Injection CI *****

=====

=> Spring container creating object and providing data using Parameterized constructor.

Here , we use <constructor-arg> tag to indicate.

Employee emp=new Employee(10, "A"); =====>

<bean>

<constructor-arg>

<value>10</value>

</constructor-arg>

<constructor-arg>

<value>A</value>

</constructor-arg>

</bean>

Note:

A. If a class has 3 param constructor then we need to pass <constructor-arg> 3 times in xml config file.

B. Data must be passed in order using <constructor-arg> as per constructor defined in class.

=====

code for CI (constructor Injection)

Spring Annotation Configuration

This is Easy to Configure

Faster in execution compare to xml.

=====

1. Stereotype Annotation:

These annotation informs Spring Container to create Object.

They are 5 Annotation given by Spring Framework.

@Component : Create object inside container.

@Repository : Creates object + Database operations

@Service : Creates object + Transaction/logic/calculation..etc

@Controller : Creates object + Http Protocol (Web App)

@RestController : Creates object + Http Protocol (webservice)

@ComponentScan

@ComponentScans

2. Data Annotation/ Basic Annotation

@Value Annotation is used to provide data (field inject) to variable.

It has 3 usages:

1. Hard coding direct value to a variable.
2. Reading Data from Properties/YAML Files
3. - SpEL (Spring Expression language)

@Autowire

@Qualifier

@Primary

Spring Annotation Configuration:

1. @Component : create Object to given class

2. @Value : To provide data (Field Injection) to variable

3. @ComponentScan : To find classes using basepackage.

=====Properties File=====

_____.properties

=> This is also called as key-val pair input as Text format(String)

=> This file is used to provide setup data to application.

=> Here, we can read data from properties file into variable using @Value("\${key}")

=> Programmer has to define and load Properties file.

Use @PropertySource annotation to load file, into spring container.

=> container creates Environment() Object (internally used StandardEnvironment(c)).

=> we can read data using @Value("\${keyName}")

=> if we define duplicate key with different value (not recommended then last combination is taken into Container)

=====

myapp.properties

#Symbol allowed for comment '#'

#key=value

#Symbol allowed to write keyName (dot(.), dash(-), underscore(_))

my.driver=oracle

my.url=oracle-jdbc

my.username=system

my.password=root

my.port=3306

my.active=false

=====

my.port=4444 will be printed

=====

=> For boolean datatype valid input are : false and true

(case-insensitive, False, FALSE, True, TRUE etc)

=====

=====

Spring Annotation configuration

@Component Annotation : To create Object

@Value : Direct value to a variable / Read data from properties

@ComponentScan : back-Package to scan classes

@PropertySource : To Load Properties File

Autowiring

@Autowired Annotation

=> It is a process of Linking objects based on Association Mapping (HAS-A)

=> @Autowired Annotation is used. So, that container can link them.

=> Autowired Annotation Injects Dependecny Beans into Dependent bean.

=> In Case of XML Configuration <ref/> tag is used to link objects.

=====

1. @Autowired will search for child class object.

2. If one child object is found then it is injected.

3. If Zero child object are found then throw exception NoSuchBeanDefinitionException, message like:

At least 1 bean required

Spring Bean -LifeCycle Methods

LifeCycle Methods : If a method is called by container/runtime in between Object creation and destroy.

Spring F/W : 2 LifeCycle Methods (they are optional)

1. init-method : called after creating object
2. destroy-method : called before Destroying object

File(data) -----> open file-----> Read data-----variable-> close File

We can implement LifeCycle Methods in 3 way

1. xml configuration

```
<bean ..... init-method="" destroy-method="">
```

=>we can define methods with any name, using below syntax:

```
public void <method_name>(){
```

```
//logic....
```

}

2. spring Lifecycle Interface:

=> Spring f/w has given 2 interfaces to implement lifecycle methods.

They are:

A. InitializingBean(I)

afterPropertiesSet()

B. DisposableBean(I)

Destroy()

=> Your Spring bean can implement above interface and override methods.

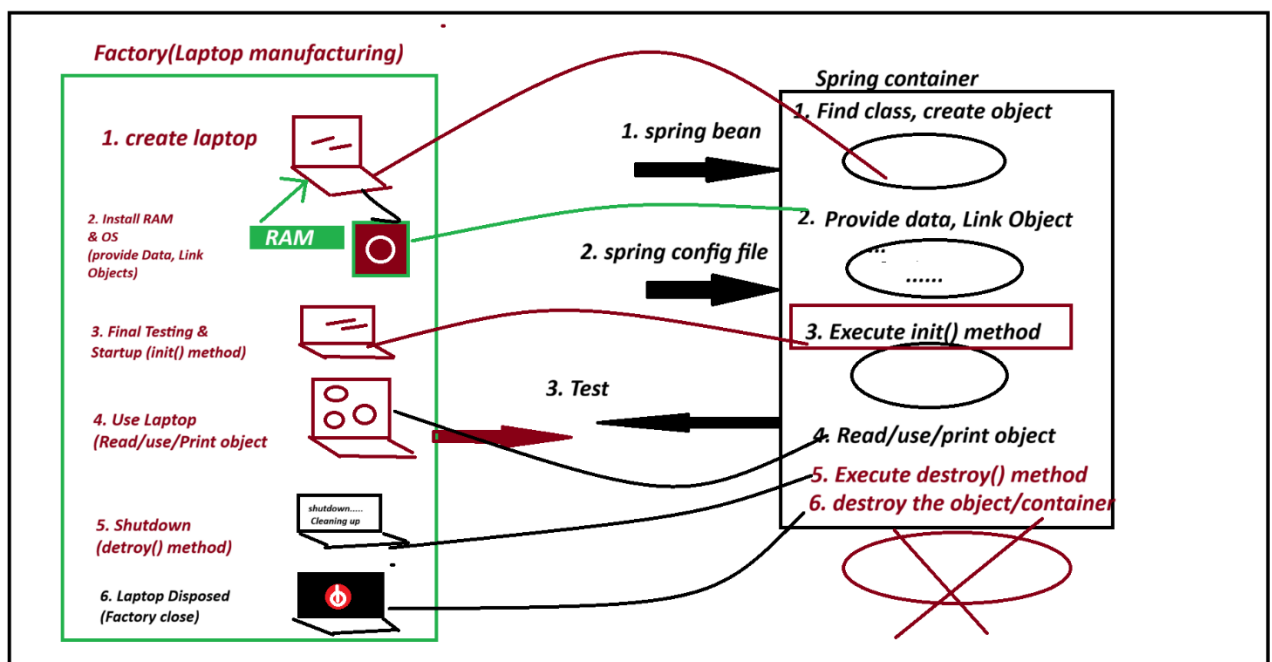

They are called by spring container.

3. JSR-Annotation : These are generic annotation Given by Sun/oracle .

a. @PostConstruct

b. @PreDestroy

diagram

=====code=====

1. xml cofiguration

```
<bean ..... init-method="" destroy-method="">
```

=>we can define methods with any name, using below syntax:

```
    public void <method_name>(){  
//logic....  
}
```

=====

Spring - Java Configuration

=====

XML Configuration -- <bean> <property> <value> .. etc

Annotation configuration -- @Component, @Value, @Autowired .etc

java configuration -@Configuration @Bean

=====

java configuration -@Configuration @Bean

1. Define one public class with any name (ex MyApp.java)
2. Apply @Configuration another over class
3. For one object = define one method

@Bean

```
public PdfExport pObj(){  
    PdfExport p = new PdfExport();  
    p.setFileName("sbms");  
    p.setFileAuth("IndiaFreeInternship");  
    return p;  
  
}
```

4. Add @Bean over method

1. Consider given class (spring bean) is a pre-defined class.

can we use Annotation config?

=> No. We can't Annotation configuration.

we can use annotation configuration we have source code only.

(_____.java) file

2. Can we xml/java configuration to define one bean for pre-defined class?

yes Both support any type of class of configuration (pre-defined and user-defined)

3. what is the mean of @Configuration and @Bean?

@Configuration says "i am java config file"

@Bean - please create one object inside spring container

4. what is the diff b/w @Component and @Bean?

@Component - used for programmer defined

@Bean - Mainly for pre-defined class (support both pre-defined and user defined)

5. why we use Annotation configuration mostly

execution fast (short code)

in java configuration (lengthy code and slow execution)

=====

example code

=====
```

Point	xml configuration	Annotation Configuration	Java Configuration
How to define Bean	<bean> tag in XML file	@Component, @Value, @Autowired	@Configuration class with @Bean tag
Need of Source Code	No	Yes(must have .java file)	No (Work for both)
Supports	Both pre-defined and user-defined classes	Only User-defined classes	Both pre-defined and user-defined classes
Multiple beans	Yes	Yes	Yes(easier)
Readability	Medium	High	High
Moder Approach	No	Yes(most used)	Yes

PRE-DEFINED CLASS

classes which are already available in libraries or framework.

we don't have source code. (.java)

ex:

JdbcTemplate
 DriverManagerDataSource
 RestTemplate
 ArrayList(java API)

We Cannot apply @Component
 (Cannot modify source code)

USER-DEFINED CLASS

Classes which are created by Programmer
 We have source code (.java)

Ex

Student.java
 Employee.java
 Product.java
 PdfExport.java

We can apply @Component
 (We own the source code)
